• Self-adjusting Design Requires No Motors or Outside Power Source.
• Maintains Accurate, Constant Upstream Levels
• 21 Standard Sizes to Fit Most Flow Requirements
• For Flood Control, Water Management Systems, Irrigation, Flow Equalization, UV Level Control And Clarifier Odor Control in Water and Wastewater Treatment

The Golden Harvest, Inc. Model GH-9000 Level Control Gate utilizes force-balance control to automatically maintain a constant upstream water level at any given discharge while minimizing head loss.

Sizes and materials of construction are available to meet a wide variety of flow control needs ranging from almost zero to 2000 cfs. The gate nearly closes at low discharge and progressively opens as the flow increases.

The level control gate operates completely free of outside power and after initial adjustment absolutely no manual intervention is required. While the initial purchase cost is competitive with other systems the GH-9000 offers substantial life cycle cost benefits. The costs associated with PLC relays, modulating actuators, maintenance, replacement and energy are relieved.

Water distribution networks utilizing the GH-9000 become simplified and cost effective as ditch riders are no longer required to periodically adjust gates or manipulate flash boards at GH-9000 check structures. Thus, a more accurate and flexible distribution system is made available, reducing costly time and water waste. In addition, damage due to overtopping of banks is eliminated as the level control gates operate instantly year round to relieve or maintain a wide range of flows.

**CONSTANT UPSTREAM LEVEL CONTROL GATE**

**OPERATING PRINCIPAL**

The gate consists of a cylindrical leaf with a cylindrical buoyant compartment provided on its upstream side and balancing ballast containers to the rear. The fabricated elements make up a rigid frame that rotates freely around a horizontal trunnion axis.

The gate is located over the center of axis so that hydraulic thrust on the gate leaf passes through the axis and does not effect the equilibrium. The torques generated by hydraulic force, buoyancy, and weight of the gate are equal and opposite for any angular position of the GHI Model 9000 level control gate.

As a rule the gate is set so that its trunnion axis coincides with the maximum upstream water level. As long as this condition is fulfilled, the gate will remain in complete equilibrium, when flows vary the gate automatically adjusts up or down passing the exact discharge required to keep the upstream water level constant.

CONSTANT UPSTREAM LEVEL CONTROL GATE

LEVEL CONTROL GATE SELECTION
Golden Harvest, Inc offers 21 standard sizes to suit a variety of applications. The following data is required to select a suitable gate for a given structure:

- the maximum discharge (Q) to be handled
- the minimum head differential (J) at maximum discharge

Note: Where a gate is followed by a fall use 3.5 ft for (J)

EXAMPLE 1 (MGD):
A wastewater treatment plant has a treatment capacity of 8 mgd. A dual channel U.V. system safely disinfects a maximum discharge of 4 mgd per channel-unit. The U.V. bulbs require a constant water elevation 635.00 ft. maximum tailwater elevation is 632.00

The minimum head differential:
\[ J = 635.00 - 632.00 = 3.0 \text{ ft.} \]

Point “a” on the chart corresponds to (Q) = 4 mgd and (J) = 3.0 ft. The appropriate size for the two parallel gates is a US-35.

EXAMPLE 2 (CFS):
The water level in a canal must be kept constant at elevation 100 ft., where the maximum discharge is 200 cfs with a maximum downstream water elevation at 99.5 ft.

The minimum head differential:
\[ J = 100.00 - 99.50 = 0.50 \text{ ft.} \]

Point “b” on the chart corresponds to (Q) = 200 cfs and (J) = 0.5 ft. The appropriate gate size is the US-157.

Note: The US-157 has a discharge capacity of approx. 350 cfs.

CONTROL STRUCTURE
Prefabricated Control Structures are designed and built specific to a wide variety of applications. Fabricated sluiceways are particularly attractive for smaller applications (Size US-31 up to size US-86 - larger sizes are available).

Utilizing the prefabricated sluiceway takes the place of designing and building a concrete structure. The gate and sluiceway come packaged for easy and quick installation.

The prefab sluiceway can be adjusted or relocated at minimal cost if a revised water level or new turnout location is desired.

On concrete rectangular channels, a smaller prefabricated control structure can be installed without dewatering.

GH-9000 SERIES GATE APPLICATIONS

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drainage Canals</td>
<td>Retainage of high water surface in the drainage system providing for ground water recharge and wetlands management during dry seasons.</td>
</tr>
<tr>
<td>Recreation Lakes and Reservoirs</td>
<td>Water level is maintained in all seasons without sacrificing spillway capacity or reliability and reduces threat of residential flooding.</td>
</tr>
<tr>
<td>Flood Control</td>
<td>Automatic protection of flood zones by using the GH-9000 Series gate as an inlet to storm water retention system.</td>
</tr>
<tr>
<td>Irrigation Canals</td>
<td>Automatic canal check gates for reliable turn-out control at all flows.</td>
</tr>
<tr>
<td>Wastewater Treatment</td>
<td>With the GH-9000 Series gate placed at the outlet of a clarifier it will maintain a constant higher water level in the effluent troughs, thereby reducing the release of odorous gases.</td>
</tr>
<tr>
<td>Hydro-Electric</td>
<td>Optimization of forebay levels while providing instant bypass during scheduled or unscheduled plant shut-downs.</td>
</tr>
<tr>
<td></td>
<td>Increase hydro profitability by drawing stream diurnal flow increases into the forebay while maintaining minimum required fish and recreation flows in the stream.</td>
</tr>
</tbody>
</table>

Automatic level control for U.V. disinfection channels maintain constant and desired upstream water levels to decrease chances of UV bulb burnout when water levels are too low and to prevent inefficient U.V treatment when water levels are too high.

Automatic regulation of sedimentation / flow equalization basin levels during fluctuating flow rates.
